5.4	Study Selection	13

Chapter 1

Preamble

The book you see in front of you is the outcome of an eight week seminar run by the Software Engineering Research Group (SERG) at TU Delft. We have split up the novel area of Software Analytics into several sub topics. Every chapter addresses one such sub-topic of Software Analytics and is the outcome of a systematic literature review a laborious team of 3-4 students performed.

With this book, we hope to structure the new field of Software Analytics and show how it is related to many long existing research fields.

Chapter 2

A contemporary view on Software Analytics

2.1 What is Software Analytics?

2.2 A list of Software Analytics Sub-Topics

Chapter 3

Sample Sub-Topic

This is an example for the deliverable every group works on. Every group works on one independent chapter (starting as one Rmd file).

Chapter 4

Final Words

We have finished a nice book on Software Analytics.

Chapter 5

Build analytics

5.1 Background

When building a project from source code to executables everything should go smoothly. This is not always the case, a build can break for several reasons. This chapter will give an overview of research done on build scripts and continuous integration.

5.2 Research Questions

- What are causes of a broken build?
- With which goals is continuous integration applied?

5.3 Search Strategy

Using the initial seed consisting of Bird and Zimmermann (2017), Beller et al. (2017a), Rausch et al. (2017), Beller et al. (2017b), Pinto and Rebouças (2018), Zhao et al. (2017), Widder et al. (2018) and Hilton et al. (2016) we used references and similar keywords to find new papers to analyze.

5.4 Study Selection

Through this we found the following papers

5.4.1 Vassallo et al. (2017)

Discusses the difference in failures on continuous integration between open source software (OSS) and industrial software projects. For this 349 Java OSS projects and 418 project from ING Nederland, a financial organisation.

Using cluser analysis it was observed that both kinds of projects share similar build failures, but in other cases very different patterns emerge.

5.4.2 Hassan and Wang (2018)

This paper uses TravisTorrent (Beller et al. (2017b)) to show that 22% of code commits include changes in build script files to keep the build working or to fix the build.

In the paper a tool is proposed to automatically fix build failures based on previous changes.

5.4.3 Vassallo et al. (2018)

5.4.4 Zampetti et al. (2017)
